## 1 Conditional statements

### 1.1 Boolean data type

Boolean data type takes one of two possible logical values: "true" or "false". Matlab stores "false" and "true" as 0 and 1 respectively.

### 1.2 Conditional expressions

The result of a conditional expression is of boolean type.

Examples of conditional expressions

```
1 a = 10;  
2  
3 a < 30 % true
```

```
4 a > 20 % false
5 a == 10 % true
6 a == 11 % false
```

### 1.3 if statement

if statement allows you to perform different computations or actions depending on whether a condition evaluates to true or false.

Basic syntax is:

```
1 if condition
2     code
3 end
```

Example:

```
1 a = 10; % try to change the value!
2
3 if a > 9
4     disp('a is greater than 9');
5 end
6
7
8 if a < 20
9     disp('a is less than 20');
10 end
```

### 1.4 else statement

Code in the `else` block will be executed if `condition` is false.

Basic syntax:

```
1 if condition
2     code1
3 else
4     code2
5 end
```

Example:

```
1 a = 20;
2
```

```

3 if a < 40
4     disp('a is less than 40');
5 else
6     disp('a is greater than 40');
7 end

```

## 1.5 elseif statement

**elseif** statement allows to combine several conditions. Only the code following the first condition that is found to be true will be executed. All other code will be skipped.

Basic syntax:

```

1 if condition1
2     code1
3 elseif condition2
4     code2
5 elseif condition3
6     code3
7 ...
8 else
9     code
10 end

```

Examples:

```

1 a = 10; % try to set a = 4; a = 5; a = 6;
2
3 if a > 5
4     disp('a > 5');
5 elseif a < 5
6     disp('a < 5');
7 else
8     disp('a == 5');
9 end

```

## 1.6 and/or/not operators

If you want to have complex conditions which consist of more than one logical statement, you can use logical "and", "or" and "not" operators.

### 1.6.1 And

The "and" of two or more conditions is true if each of the conditions is true. For example, **a and b** is true only if **a** and **b** are both true.

In Matlab, logical "and" is written as **&&**.

Example:

```
1 a = 10;
2
3 if a > 5 && a < 15
4     disp('a > 5 and a < 15');
5 else
6     disp('a <= 5 or a >= 15');
7 end
```

### 1.6.2 Or

The "or" of two or more conditions is true if at least one of the conditions is true. For example, **a or b** is true if either **a** or **b** (or both) are true.

In Matlab, logical "or" is written as **||**.

Example:

```
1 a = 10;
2
3 if a < 5 || a > 9
4     disp('a < 5 or a > 9');
5 else
6     disp('9 => a >= 5');
7 end
```

### 1.6.3 Not

**not** operator negates the condition. If **a** is true, then **not a** is false. If **a** is false, then **not a** is true.

In Matlab, logical "not" is written as **~**.

Example:

```
1 a = 10
2
3 if ~(a > 0)
4     disp('a <= 0');
```

```

5 else
6     disp('a > 0');
7 end

```

## 2 Receiving user input

In Matlab, it is possible to interactively ask for user input using command `input()`. It is possible to print some text as an invitation for a user. The user is expected to write some value using his/her keyboard and hit Enter when done.

```

1 clear;
2 price = input('Please write the price of an item and
               press Enter: '); % The text between parenthesis
                               will be printed as an invitation
3 amount = input('Please write amount of items to order
                 and press Enter: '); % The text between
                                     parenthesis will be printed as an invitation
4
5 total = price*amount
6 disp('The total price is:')
7 disp(total)

```

## 3 Task 2

Tax agency asks you to write a program which asks user to state his/her income and prints how much taxes must be paid. The amount of taxes depends on the income as follows:

- If income is greater or equal to 10 000 000\$ or user has negative income (losses) then print text with warning that the estimation is preliminary and invite the user to contact local branch.
- If income is less than 1000\$ then no taxes are applied
- Else if income is between 1000\$ and 3000\$ (including 1000) then 10% should be paid

- Else if income is greater or equal to 3000\$ then 40% should be paid but not more than 10 000\$

You can test your program on the following data:

- If income is -1000\$, tax estimation is 0\$ and a warning is printed
- If income is 500\$, tax estimation is 0\$
- If income is 1000\$, tax estimation is 100\$
- If income is 2000\$, tax estimation is 200\$
- If income is 3000\$, tax estimation is 1200\$
- If income is 1 000 000\$, tax estimation is 10 000\$
- If income is 9999999999\$, tax estimation is 10 000\$ and a warning is printed
